

# On your way in...

## Pick-up:

### 1. POGIL Activity: Classes 24b, 25b

- Slots
  - Methods (Replaces 25)
- 
- (No homework today!)
  - Midterm has been postponed.

# Midterm Exam is Thursday, March 12

- ~~TPL 203: 5:45pm-7:45pm OR 8-10pm.~~
  - The midterm exam has been postponed.
- Closed book exam
- Review your homeworks! POGILs! Slides! Labs!
- HW4 Solutions: [On the course website, here](#)
- Midterm Review Notes: [On course website, here](#)

# ANNOUNCEMENTS

- As classes have been canceled next week...
- Midterm exam has been postponed until after spring break
- TA Student Help Hours are canceled Wednesday & Thursday
- Iris has Student Help hours Thursday 10a-12p
  - Shikha's Student Help Hours are canceled unless otherwise noted

Please read email from Shikha at  
1:30pm today/Wednesday  
"Midterm postponed and  
logistics on going remote"

Please fill out the [CS134 Remote Questionnaire \(click here\)](#)  
The CS department has a page of [Resources for Remote Work](#).

Please bring your personal laptop to class on Friday  
so we can try to get you set-up.

You might be able to [borrow a laptop longterm](#) from the library.

# Welcome to CS 134!

Introduction to Computer Science  
Iris Howley

-Random & Iterators & Classes-

# TODAY'S LESSON

Getting & using random values

(Unpredictable values are useful for certain tasks, like shuffling.)

# random.randint

Randomly selects an integer between two given bounds, inclusive

```
>>> import random
```

```
>>> random.randint(0,1)
```

```
0
```

```
>>> random.randint(0,1)
```

```
1
```

```
>>> random.randint(0,1)
```

```
0
```

```
>>> randNums = [randint(5,40) for _ in range(5)]
```

```
>>> randNums
```

```
[11, 18, 22, 13, 13]
```

Underscore means  
it's a variable we  
don't care about

# random.choice

Randomly selects and returns an element from a given sequence

```
>>> import random
>>> random.choice('abcdefg')
'b'
>>> random.choice('abcdefg')
'd'
>>> random.choice('abcdefg')
'f'
>>> random.choice('abcdefg')
'c'
>>> random.choice('abcdefg')
'f'
>>> random.choice([0,1,2,6,7])
6
>>> random.choice([0,1,2,6,7])
0
>>> random.choice([0,1,2,6,7])
1
>>> random.choice([0,1,2,6,7])
7
>>> random.choice([0,1,2,6,7])
0
>>> random.choice([0,1,2,6,7])
0
```

# random.shuffle

Destructively, randomly reorders a mutable sequence

```
>>> import random
>>> random.shuffle([0,1,2,6,7])
>>> lst = [0,1,2,6,7]    >>> yogi = ['yabba','dabba','do']
>>> random.shuffle(lst) >>> random.shuffle(yogi)
>>> lst                  >>> yogi
[2, 1, 7, 6, 0]         ['do', 'yabba', 'dabba']
                        >>> random.shuffle(yogi)
                        >>> yogi
                        ['dabba', 'yabba', 'do']
```

# random.random

Return the next random floating point number in the range [0.0, 1.0).

```
>>> import random
>>> random.random()
0.016353005994267367
>>> random.random()
0.7041482747508325
>>> random.random()
0.25723963079251566
>>> random.random()
0.10301513331081114
>>> random.random()
0.5367112693767642
>>> random.random()
0.09446571726550657
>>> random.random()
0.3013371664986967
```

**WHAT'S RANDOM USEFUL FOR?**

# Python Documentation on Random

<https://docs.python.org/3/library/random.html>

# TODAY'S LESSON

## Iterators

(objects that return one element at a time)

## Recall the Mystery Function from POGIL21 on Generators

```
def mystery(a = 0, b = 1):  
    yield a  
    yield b  
    while True:  
        a, b = b, a+b  
        yield b
```

```
g = mystery()
```

```
>>> g
```

```
<generator object mystery  
at 0x10be119e8>
```

```
>>> next(g)
```

```
0
```

```
>>> next(g)
```

```
1
```

```
>>> next(g)
```

```
1
```

```
>>> next(g)
```

```
2
```

```
>>> next(g)
```

```
3
```

```
>>> next(g)
```

```
5
```

```
>>> next(g)
```

```
8
```

```
>>> next(g)
```

```
13
```

```
>>> next(g)
```

```
21
```

```
>>> next(g)
```

```
34
```

```
>>> next(g)
```

```
55
```

# Fibonacci number

From Wikipedia, the free encyclopedia

*"Fibonacci Sequence" redirects here. For the chamber ensemble, see [Fibonacci Sequence \(ensemble\)](#).*

In [mathematics](#), the **Fibonacci numbers**, commonly denoted  $F_n$ , form a [sequence](#), called the **Fibonacci sequence**, such that each number is the sum of the two preceding ones, starting from 0 and 1.

That is,<sup>[1]</sup>

$$F_0 = 0, \quad F_1 = 1,$$

and

$$F_n = F_{n-1} + F_{n-2},$$

for  $n > 1$ .

The beginning of the sequence is thus:

0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, ...<sup>[2]</sup>

A tiling with squares whose side lengths are successive Fibonacci numbers: 1, 1, 2, 3, 5, 8, 13 and 21.

# Iterators

```
for letter in 'hello':  
    print(letter)
```

- We've been using iterators all along!
- The for statement calls `iter()` on 'hello' string
- `iter()` returns an iterator which has a `__next__()` method, which goes in and accesses each element in 'hello'
  - Returning one at a time!
- When it runs out of elements, it raises a `StopIteration` exception, so the for..loop terminates

# Iterators

```
>>> s = 'abc'
>>> it = iter(s)
>>> it          <str_iterator object at
0x107a58668>
>>> next(it)   'a'
>>> next(it)   'b'
>>> next(it)   'c'
>>> next(it)

• Traceback (most recent call last): File
  "<stdin>", line 1, in <module> next(it)
  StopIteration
```

# An Example

```
>>> s = 'hi!'
>>> it = iter(s)
>>> try:
...     print(next(it))
...     print(next(it))
...     print(next(it))
...     print(next(it))
...except StopIteration:
...     print("ERROR. Ran outta juice!")
```

```
h
i
!
ERROR. Ran outta juice!
```

# For..loops

- `for item in mylist:`
  - `print(item)`

This is really:

- `try:`
  - `it=iter(mylist)`
  - `while True:`
    - `item = next(it)`
    - `print(item)`
- `except StopIteration:`
  - `pass`

# Python Tutorial on Iterators

**POGIL 25B REPLACES POGIL 25 FROM MONDAY**

# **TODAY'S LESSON**

## Classes

(Creating new types of objects to help with encapsulation)

Book Chapters 15, 16, 17

**SO INCREDIBLY HELPFUL**

Step through it!!!!

*Highly, highly, extremely recommended*

Deslauriers et al (2019). [“Measuring actual learning versus feeling of learning in response to being actively engaged in the classroom”](#)

# POGIL Activity 25b – Classes: Methods

- Look at Python Activity 25b, Questions 4-5 (we skimmed 1-3 Monday)
- Find a partner and talk through the questions together

# POGIL – Activity 25b: Question 1

1. Examine the following code from interactive python below.

```
Interactive Python
0 >>> example = list()
1 >>> example.append(2)
2 >>> example.append(4)
3 >>> example
4 [2, 4]
```

- a. What type of object is `example`? How do you know?  
\_\_\_\_\_
- b. When we call `.append()` which object are we appending to? How do you know?  
\_\_\_\_\_
- c. If we reassigned `example` to be `'24'` what would `.append()` do?  
\_\_\_\_\_

**FYI:** Functions that operate on certain kinds of objects are called **methods** (`.append()` is a method of `List`). We have been using many methods since the beginning of the course.

- d. What are some additional methods that we have been using in this course so far?  
For lists: \_\_\_\_\_  
For strings: \_\_\_\_\_

# POGIL – Activity 25b: Question 2

2. Examine the following code below, that creates a new class in interactive python:

```
0 >>> class EvensList:
1 ...     """ A new class to store data """

2 >>> el = EvensList()
3 >>> el.items = [2,4]
4 >>> el.items
5 [2, 4]
6 >>> el.append(6)
```

- a. What type of object is `el`? How do you know?

\_\_\_\_\_

- b. What value does `el.items` hold after line 3? \_\_\_\_\_

- c. What type of object is `el.items`? How do you know?

\_\_\_\_\_

- d. What attributes does `EvensList` have? \_\_\_\_\_

- e. What does the programmer hope will happen after line 6?

\_\_\_\_\_

- f. This code will generate the following error, “`AttributeError: 'EvensList' object has no attribute 'append',`” why do you think that is?

# POGIL – Activity 25b: Question 3

---

3. Observe what happens when we enter the following lines, continuing from those above:

```
8 >>> def append(evenlst, item):
9 ...     evenlst.items.append(item)

10 >>> append(e1, 6)
11 e1.items
12 [2, 4, 6]
```

- a. How does line 10 in this example differ from line 1 in question 1?

- b. Is `append(...)` defined on lines 8 & 9 a method or a function? Why?

**FYI:** User-defined object instances can be passed to functions just like built-in object instances.

- c. How does the value of `e1.items` change in line 10?

- d. Write some lines of python to adjust the `append` function so that it only adds items to `evenlst` that are even numbers:

```
def append(evenlst, item):
```

# POGIL – Activity 25b: Question 4

4. Examine the following code below, that creates a new class in interactive python:

```
0 >>> class EvensList:
1 ...     def append(self, item):
2 ...         self.items.append(item)

4 >>> el = EvensList()
5 >>> el.items = [6,4]
6 >>> el.append(3)
7 >>> el.items
8 [6, 4, 2]
```

- a. What value does `el.items` hold after line 6? \_\_\_\_\_
- b. How does the call to `append` differ in line 6 in this example, versus line 10 in question 3?  
\_\_\_\_\_
- c. How does `append`'s function header differ in line 1 above versus line 8 in question 3?  
\_\_\_\_\_
- d. How does `append`'s function definition differ in line 2 above versus line 9 in question 3?  
\_\_\_\_\_

**FYI:** In user-defined types, we refer to the values stored in that instance through the keyword, **self**.

- e. If we were to add a line 3 to the `append` method that was `print(self.items)` what might be printed and on after what line?  
\_\_\_\_\_
- f. Modify the `append` method for `EvensList` to only append integers that are even numbers:

# POGIL – Activity 25b: Question 5

5. Examine the following code below, that creates a different version of `EvensList`, but as a script:

```
EvensList.py
0 class EvensList:
1     def __init__(self, itemList):
2         self._items = itemList
3     def append(self, item):
4         self._items.append(item)
5
6 if __name__ == '__main__':
7     betterEL = EvensList([88, 12, 4])
8     print(betterEL._items)
9     # prints [88, 12, 4]
10    betterEL.append(8)
11    print(betterEL._items)
```

- a. What two lines did we add to this definition of `EvensList` that we did not see in the previous question?

`betterEL._items.append(8)`

- b. How does our creation of the `betterEL` variable on line 6 differ in this example from creating `e1` in the previous example?

`betterEL.append(8)`

**FYI:** The `__init__` method is *implicitly* called when you instantiate a new object. It is very useful for setting up an object with an initial state or initial values.

- c. What's stored in `betterEL._items` when line 7 is printed?

- d. What's stored in `betterEL._items` after line 9 is executed?

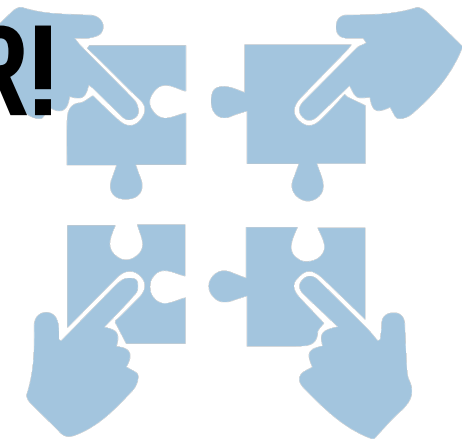

# The underscore \_ in python

- In python, objects that start with an underscore are “hidden”
  - They’re not really hidden, but it’s a convention to imply that they shouldn’t be accessed publicly
  - If you’re using an object name that starts with an underscore outside of a class definition, you should feel **GUILTY**
  - This goes for double-underscore `__<name>__` objects in python too!
- Using a variable name that is an underscore, means you don’t plan to ever use that variable:
  - ```
for _ in range(5):  
    print("Hello repeat!")
```

**YOU SHOULD COMPLETE THE REST OF  
ALL POGILS OUTSIDE OF CLASS.**

**BEST DONE WITH A PARTNER OR STUDY GROUP.**

**CHECK YOUR ANSWERS ON A COMPUTER!**

**QUESTIONS?**

**Leftover Slides**

# POGIL Activity 24b – Classes: Slots

- Look at Python Activity 24b, Questions 1-4
- Find a partner and talk through the questions together

# POGIL – Activity 24b: Question 1

1. Examine the following code from interactive python below using a Flower data structure.

```
Interactive Python
0 >>> class Flower:
1 ...     """ A new class representing flowers """

2 >>> iris = Flower()
3 >>> iris.petal = 3
4 >>> iris.petal
5 3
6 >>> iris.bloomTime
7 AttributeError: 'Flower' object has no attribute
'bloomTime'
```

- a. What type of object is `iris`? How do you know?  
\_\_\_\_\_
- b. On which line is `iris.petal` on the lefthand side of an assignment operator?  
What value is assigned? \_\_\_\_\_
- c. On which line is `iris.bloomTime` on the lefthand side of an assignment operator?  
\_\_\_\_\_
- d. Why might `iris.bloomTime` on line 7 throw an error?  
\_\_\_\_\_
- e. Write a line of python to enter before line 6, to fix the error:  
\_\_\_\_\_

# POGIL – Activity 24b: Question 2

2. Examine the following code below, which continues from the previous example:

```
8 >>> daisy = Flower()  
9 >>> daisy.nonsense = 'wut WUT'  
10 >>> daisy.nonsense  
11 'wut WUT'
```

- What differs between our assignment of `daisy` in this example, and `iris` in the earlier example? \_\_\_\_\_
- Where do we assign a value to `daisy.petal` in this example? \_\_\_\_\_
- Where do we assign a value to `daisy.nonsense` in this example? What's its value?  
\_\_\_\_\_
- Is `nonsense` a meaningful attribute for objects of type `Flower`?

# POGIL – Activity 24b: Question 3

3. Examine the following code below, that overwrites previous versions of `Flower`:

```
Interactive Python
0 >>> class Flower:
1 ...     __slots__ = ['petals']

2 >>> rose = Flower()
3 >>> rose.petal = 5
4 >>> rose.nonsense = 'May'
5 AttributeError: 'Flower object has no attribute
'nonsense'
```

- a. How does the assignment of `rose.petal` differ from the assignment of `iris.petal` in question 1? \_\_\_\_\_
- b. How does the assignment of `rose.nonsense` differ from the assignment of `daisy.nonsense` in the previous question?  
\_\_\_\_\_
- b. What happens with line 5 in this example that didn't occur in the previous question?  
\_\_\_\_\_
- c. How does the definition of the `Flower` class differ in this example, from the definition of `Flower` used in questions 1-2?  
\_\_\_\_\_  
\_\_\_\_\_

**FYI:** The `__slots__` keyword defines a list of attributes for a class object. No additional attributes can be added to an instance, unless their name appears in the `__slots__` list.

- d. What might happen if we modify line 1 to be `__slots__ = ['petals', 'nonsense']` and then ran the code?

# POGIL – Activity 24b: Question 4

4. Examine the following code below, which continues from the previous example:

```
6 >>> violet = Flower()  
7 >>> violet.petal = 5  
8 >>> violet.petal  
9 5  
10 rose.petal + violet.petal  
11 10
```

- a. What is stored in `violet.petal`?

---

- b. What is happening on line 10?

# POGIL – Activity 24b: Question 4

5. Examine the following code below, which continues from the previous example:

```
12 >>> def avgPetals(flwrList):
13 ...     total = 0
14 ...     for flwr in flwrList:
15 ...         total += flwr.petals
16 ...     return total / len(flwrList)
```

- What is an example value for `flwrList`?  

---
- What would the output for your example value in (a) result in?  

---
- What does `avgPetals` do?  

---
- Write a function, `droughtPetals`, that accepts a `Flower` object as a parameter and an integer `days`, and removes one petal from the flower for each `days` of drought:

# Class Syntax

We're defining a new type of object

```
class Book:           The name of the new type
    __slots__ = ['_title']  Only attribute for Book is '_title'
    def __init__(self):  Initializer is implicitly called when we create a new Book
        self._title = ''
    def addTitle(self, txt):  Methods must always be passed self as parameter
        self._title += txt  Object attributes are always accessed through self.
```

```
>>> b = Book()  Makes a new book, implicitly calls __init__()
```

```
>>> b._title  If init() weren't called, this would throw an error!
''
```

```
>>> b.addTitle("Harry Potter")  Even though method definition
                                     has self, method call does not!
```

```
>>> b._title
'Harry Potter'  _title starts with underscore, so we shouldn't use it!
                 There's something else we should use instead...
```

# Generators

```
def countTo(n):  
    i = 1  
    while i <= n:  
        yield i  
        i += 1
```

---

```
g = countTo(3)          print(next(g))          3  
print(next(g))         1  print(next(g))  
print(next(g))         2  ERROR StopIteration
```

# Generators

```
def countTo(n):  
    i = 1  
    while i <= n:  
        yield i  
        i += 1
```

```
g = countTo(3)  
print(next(g))    1  
print(next(g))    2
```

```
def countRet(n):  
    i = 1  
    while i <= n:  
        return i  
        i += 1
```

```
print(countRet(5))    1  
print(countRet(5))    1  
print(countRet(5))    1
```

# Can have multiple return statements

```
def countRet(n):  
    i = 1  
    while i <= n:  
         return i  
        i += 1
```

Once we reach 'return'  
we never get past it!  
i is never incremented!

```
def multRet(num):  
    if num <= 0:  
        return num  
    else:  
         return "+++"
```

"+++" is only returned if  
"return num" is never  
reached, i.e., when num  
is greater than 0.
